

Notes:

VR1 is a voltage divider to reduce the control voltage from the Filter Cutoff (pin 11) to the 0 - 5 volt control range for the 13-pin synth (pin 8). Note the 'S-Mute' connection point to mute the synth volume. Use a multimeter for calibration.

VR2 is used to adjust the normal guitar level. Note the 'G-Mute' connection point to mute the normal guitar signal.

VR3 can be used to generate a control voltage using the Resonance Control (pin 12).

SW1 can be used to select between the normal guitar signal and the hex fuzz signal (if available).
